Customer Reviews

When my cholesterol levels went sky high, I started a proactive approach to do all that I could to lower them . . . one thing I've been doing is to read all I can about the subject, including **CONTROLLING CHOLESTEROL FOR DUMMIES** (2nd ed.) by Carol Ann Rinzler. This informative guide contained all the information I wanted to know about the subject--and then some . . . I could have done without some of the material that was surprisingly technical, and 53 pages at the end about calories and other nutrients in food were about 52 too many for me. Yet that's not to say that much else of the rest of the information made it a most worthwhile book for me to have read . . . I learned, for instance, about something called BMI or body mass index: * BMI is a unisex measure of weight relative to height, a number--such as 24--that serves as a predictor of your risk for weight-related illnesses, such as diabetes, high blood pressure, heart disease, stroke, gallbladder disease, and arthritic pain. The higher your number, the higher your risk . . . The equation looks like this: $BMI = (\text{weight in pounds} / \text{height in inches} \times \text{height in inches}) \times 705$ To get your own BMI, plug your numbers into the BMI equation. For example, if you're 5' 3" tall and weight 138 pounds, the result is 24.5. Its significance lies in the fact that after you do the computation, you can effectively use it to view the various categories of BMI (and what they mean): Underweight: BMI lower than 18.5. Normal: BMI of 25 to 29.9 (A moderate risk of weight-related health problems.) Overweight: BMI of 30 to 34.9. Obese: BMI of 35 or higher.
